

METAL DETECTABLE

UNIMOP "Quality without concession"

In 1970, Unimop started the sale of products for the professional and institutional cleaning industries.

In the late 1980s, this market required special products for food processing kitchens and industry. This development prompted Unimop BV to offer high-quality products to meet the industry's needs.

Unimop BV stands for development and improvement in collaboration with its customers and suppliers.

UNIMOP "concepts in cleaning"

Products

Unimop BV provides products for professional cleaning and institutional cleaning. Besides Hyline, our range of hygiene brushes, we also offer brushes under the customer's private label. Of course this is done in consultation with the customer and requires some preparation.

Making your job so much easier...

Designed with Metal Elements in the filaments, so they can be detected. Giving you peace of mind!

All metal detectable items are made for 'very high risk' food processing areas. Most of them are available in 4 colours (blue, red, yellow and green), others are only available in blue (and red).

The magnetic field is produced by using iron dust into the mall. The products are made of very strong plastic components and have a total new design. Another advantage is that these tools are anti-static.

Unimop BV is also extending this range and developing more items that can be used in this range of metal detectable products.
